of many-valued logic. It focuses on fixed and approximate reasoning opposed to fixed and exact reasoning. A variable in fuzzy logic can take a truth value range between 0 and 1, as opposed to taking true or false in traditional binary sets. Neural networks (NN) or artificial neural networks (ANN) is a computational model that is developed based on the biological neural networks.

Difference Between Fuzzy Logic and Neural Network ...

Fuzzy logic is largely used to define the weights, from fuzzy sets, in neural networks. When crisp values are not possible to apply, then fuzzy values are used. We have already studied that training and learning help neural networks perform better in unexpected situations. At that time fuzzy values would be more applicable than crisp values.

Basic principles of fuzzy logic and neural networks ...

Fuzzy neural networks are software systems that attempt to approximate the way in which the human brain functions. They do this by utilizing two key research areas in computer science technology — fuzzy logic software development and neural network processing architecture. Fuzzy logic software attempts to account for real-world gray areas in the decision making structure of computer software programs that go beyond simple yes or no choices.

Fuzzy Logic and Neural Networks - Course

Neuro-fuzzy hybridization results in a hybrid intelligent system that synergizes these two techniques by combining the human-like reasoning style of fuzzy systems with the learning and connectionist structure of neural networks. Neuro-fuzzy hybridization is widely termed as fuzzy neural network (FNN) or neuro-fuzzy system (NFS) in the literature. Neuro-fuzzy system (the more popular term is used henceforth) incorporates the human-like reasoning style of fuzzy systems through the use of fuzzy ...

Neural Networks, Fuzzy Logic and Genetic Algorithms ...

In fuzzy mathematics, fuzzy logic is a form of many-valued logic in which the truth values of variables may be any real number between 0 and 1 both inclusive. It is employed to handle the concept of partial truth, where the truth value may range between completely true and completely false. By contrast, in Boolean logic, the truth values of variables may only be the integer values 0 or 1.
