The corrosion data in this section is mainly based on the results of general corrosion laboratory tests, which are not strictly comparable with actual service conditions. The corrosion tables provide an initial guide to the selection of materials and are intended to facilitate understanding of the different types of corrosion damage that can arise due to poor material selection.

alloy, corrosion, environmental effects, fabrication and joining techniques. Design data are presented, as available, and these data are complemented with information on the typical behavior of the alloy. The major source used for the design data is the Department of Defense document, Military Handbook- 5A.

directly affected by the corrosion process. Indirect techniques are those that provide data on parameters that either affect, or are affected by, the corrosiveness of the environment or the products of the corrosion process. The above categorization provides a good method of segregating the techniques. In general, the techniques have
