Casting Simulation with MAGMASOFT MAGMASOFT is solidification modeling software designed to optimize the casting process by simulating it on a computer. A 3-D model of the pattern or part is created and simulations are run to find potential problems, of which porosity level, turbulence in the gating system an air entrapment are just a few.

The new solidification model computes the solidification path and material properties, including latent heat, thermal conductivity, heat capacity, density, viscosity, etc. from the evolution of temperature and chemistry considering nucleation, segregation, and cooling conditions. The solidification model predicts the microstructure evolution based on composition and cooling conditions, such as secondary dendrite arm sapcing

(SDAS) and grain size.

SOLIDCast is a casting simulation software program which can simulate thermal changes and heat transfer in the solidification process of a casting. It assists the user to visualize the solidification process of a particular casting.

Solidification modeling of iron castings using SOLIDCast

Solidification Processes and with the goal of developing a well-characterized casting experiment that would be a useful benchmark for the modeling community, a team at the University of Birmingham, United Kingdom, devised a simple plate design for group testing. The geometry had to be as simple as possible since the
