Polymer Degradation and Stability

Polymer Degradation and Stability deals with the degradation reactions and their control which are a major preoccupation of practitioners of the many and diverse aspects of modern polymer technology. Deteriorative reactions occur during processing, when polymers are subjected to heat, oxygen and mechanical stress, and during the useful life of the materials when oxygen and sunlight are the most important degradative agencies.

Polymer Stability & Degradation. Our research interests have included the investigation into mechanisms of polymer degradation both reversible and irreversible. Reversible processes are often referred to as physical aging or creep and stress relaxation. These processes are thermodynamically reversible given the appropriate processing conditions.
