A peripheral vascular bypass, also called a lower extremity bypass, is the surgical rerouting of blood flow around an obstructed artery that supplies blood to the legs and feet. This surgery is performed when the buildup of fatty deposits (plaque) in an artery has blocked the normal flow of blood that carries oxygen and nutrients to the lower extremities.

### **Peripheral Vascular Bypass Surgery - procedure, recovery**

...

The arteries targeted for bypass are in the hip, thigh, behind the knee, and the lower leg. Most patients with PAD in the legs have already had at least one angioplasty, usually with stents or balloons, to try to open blocked veins and arteries. A bypass is usually required when the vein or artery can no longer remain open even with stents.

You had peripheral artery bypass surgery to re-route the blood supply around a blocked artery in one of your legs. Your surgeon made an incision (cut) over the area where the artery was blocked. This may have been in your leg or groin, or the lower part of your belly. Clamps were placed over the artery at each end of the blocked section.
