Chapter 7: Pulse Modulation Pulse-code modulation (PCM) (continued) Advantages of PCM systems In long-distance communications, PCM signals can be completely regenerated (noise-free) at intermediate repeater stations because all the information is contained in the code. The effects of noise do not accumulate and only the transmission noise

Chapter 7: Angle Modulation Transmission - Tomasi Review

Pulse modulation is a type of modulation in which the signal is transmitted in the form of pulses. It can be used to transmit analogue information. In pulse modulation, continuous signals are sampled at regular intervals. Pulse modulation can be classified into two major types. Analogue: Indication of sample amplitude is infinitely variable

Pulse amplitude modulation is defined as the data transmission by altering the amplitudes (power levels or voltage) of every pulse in a regular time sequence of electromagnetic pulses. The possible number of amplitudes can be infinite, but mostly it is some power of two so that the final output signal can be digital.
