Abstract. Diabetes mellitus elicits cellular, epigenetic, and post-translational changes that directly or indirectly affect the biology of the vasculature and other metabolic systems resulting in the apparition of cardiovascular disease. In this review,

The pathophysiology of diabetes is related to the levels of insulin within the body, and the body's ability to utilize insulin. There is a total lack of insulin in type 1 diabetes, while in type 2 diabetes, the peripheral tissues resist the effects of insulin. Normally, the pancreatic beta cells release insulin due to increased blood glucose
