A fractal is an irregular, self-similar geometric object that can be subdivided into parts each of which is a reduced-size copy of the whole. Fractals are therefore scale-invariant since they appear identical following scale reduction or magnification. Fractal concepts were originally developed during the 1960s by mathematician Benoit Mandelbrot.

The scaling property of fractal signal is very much appealing for descriptions of many geological features. Based on well-log measurements, Earth's physical properties have been found to exhibit fractal behaviour. Many authors have incorporated this finding in various geophysical techniques to improve their interpretive utility.
