Hi, I am interested in learning on how to model Laminates in Nastran using just Plate elements i.e. without defining the stack up sequence. Can think about it as defining the laminate properties in a smeared way.

FYI, I was able to run the analysis without errors. But I wanted some feedback on definition of 3D solid laminate element in Femap/NX Nastran. Let me provide some info which may be required. The composite laminate (doubler) is 0.0741" thick and consists of 13 plies. While modeling the doubler in FE, I chose 2 solid elements through the thickness.

Chapter 4: Modeling of Composite Modeling of Composites in Finite Element Environments Composites can be modeled using single layer shells, multi-layer shells (continuum shells) and/or solids. In case of solids, each ply needs to be modeled with at least one solid element. This requires a huge number of solid elements to model a simple plate.

Chapter 4: Composite Pre-Processing

It is also prohibitively expensive to create prototypes of products made from composites, so simulation must play a key role in the development of new products using laminate composite materials. Simcenter is at the leading-edge of composites analysis through continuous development of material models and element types.
