Scale-Free Networks

In this work we analyze scale-free networks with different power law spectra $N(k) \sim k^{-\gamma}$ under a boolean dynamic, where the boolean rule that each node obeys is a function of its connectivity k . This is done by using only two logical functions (AND and XOR) which are controlled by a parameter q . Using damage spreading technique we show that the Hamming distance and the number of 1's ...

A Scale-free Network with Boolean Dynamics as a Function ...

A scale-free network is a network whose degree distribution follows a power law, at least asymptotically. That is, the fraction P of nodes in the network having k connections to other nodes goes for large values of k as $P \sim k^{-\gamma}$ where γ is a parameter whose value is typically in the range $2 < \gamma < 3$, although occasionally it may lie outside these bounds. Many networks have been ...

A model based on a growing network with preferential attachment of new links can describe both regimes. Scale free networks have important implications for numerous systems. Scale Free Networks Robin Coope April 4 2003 Motivation Many networks, (www links, biochemical & social networks) show $P(k) \sim k^{-\gamma}$ scale free behaviour.

A legacy of the scale-free property is the re- alization that the structure and the evolution of networks are inseparable (6). Indeed, traditional networkmodelsaimedtoconnectafixednumber of nodes with cleverly placed links. The scale-free property forced us to acknowledge that networks constantlychangebecauseofthearrivalofnodes and links (Fig. 1).

Two well-known and much studied classes of complex networks are scale-free networks and small-world networks, whose discovery and definition are canonical case-studies in the field. Both are characterized by specific structural features— power-law degree distributions for the former and short path lengths and high clustering for the latter.
