Biofuel is fuel that is produced through contemporary processes from biomass, rather than by the very slow geological processes involved in the formation of fossil fuels, such as oil.Since biomass technically can be used as a fuel directly (e.g. wood logs), some people use the terms biomass and biofuel interchangeably. More often than not, however, the word biomass simply denotes the ...

The contribution of different biofuels to reducing fossil-fuel consumption varies widely when the fossil energy used as an input in their production is also taken into account. The fossil energy balance of a biofuel depends on factors such as feedstock characteristics, production location, agricultural practices and the source of energy used for the conversion process.

### 4. What are the environmental impacts of biofuel production?

Synonyms: Ergot; Rye Ergot; spurred rye Ergot is a fungal disease very commonly and widely observed on a good number of wild as well as cultivated grasses, and is produced by different species of claviceps. This particular disease is usually characterized by the formation of hard and seed like "ergots" in place of the normal seeds.
